

OUR ENVIRONMENTAL COMMITMENT

ENVIRONMENTAL CONSCIOUSNESS is at the forefront of all that we do. WhiteWater is committed to mitigating environmental risk at every stage of our business, promoting biodiversity, restoring habitats and being good stewards of our environment.

Environmental Rules & Energy Infrastructure

Energy infrastructure projects and operations are subject to extensive regulatory oversight at the local, state and federal levels. WhiteWater maintains compliance with all regulatory facets, from agencies like the Texas Rail Road Commission, Texas Parks and Wildlife, US Fish and Wildlife Services, the EPA and the US Army Corps of Engineers. We leverage the latest technologies available on our projects and implement industry best practices to build the most efficient, low-emission infrastructure for our customers.

Environmental Best Practices At Every Stage

As a Texas-based company, we remain deeply committed to biodiversity, wildlife conservation, and native habitat restoration on all our projects. At the beginning of every project, detailed and thoughtful planning is undertaken to ensure our proposed routes minimize risk to the environment. Some examples of how we achieve this include minimizing the number of water crossings and avoiding environmentally sensitive or archeological sites whenever possible. We also adhere to a host of

ecological considerations and wildlife protection plans. Special accommodations for endangered plants and animals are determined by independent environmental studies, which provide us with expert guidance in accordance with regulatory protocols. Once construction is complete, our teams uphold the highest standards for restoring local habitats, biodiversity and maintaining rights-of-way for the safety of our operations, landowners and the local communities.

Climate Change & Sustainability

Understanding and mitigating climate risks are key to our future business success. WhiteWater acknowledges the concern climate change poses and is taking action within our own operations and through our involvement with industry initiatives such as the [ONEFuture Coalition](#) and the [Environmental Partnership](#). We are pursuing the latest technologies to reduce fugitive GHG emissions, especially methane, which is a major priority to combat climate change.

We remain focused on expanding delivery of natural gas for our customers, which will serve as a bridge fuel from today's economy to a lower carbon energy future. As we do this, WhiteWater strives to be a leader in sustainable, low-emissions infrastructure for our customers, for our investors, and for our communities.
